ROBEM I Prove:  $F \subset \mathcal{N}$  is closed set  $\iff F = [T]$  for some  $T \subset {}^{<\omega}\omega$ .

- SPERON.  $\Longrightarrow$ : Let  $T:=T_F$ , now we need to prove F=[T]. Form the defination of  $T_F$  and [T] easily we get  $F\subset [T]$ . Now we prove  $[T]\subset F$ . For  $f\in [T]$ , we get  $f\upharpoonright n\in T$ . i.e.,  $\forall n\in\mathbb{N}, f\upharpoonright n=g\upharpoonright n$  for some  $g\in F$ . So  $d(f,F)\leq d(f,g)=\frac{1}{2^n}$ . Since F is closed, we get  $f\in F$ .
  - $\Leftarrow$ : For any  $[T] \in {}^{<\omega}\omega$ , we need to prove [T] is closed. Assume  $f \in \overline{[T]}$ , then  $\forall n \in \mathbb{N}, \exists g \in [T], f \upharpoonright n = g \upharpoonright n$ . Since  $g \in [T]$  we get  $f \upharpoonright n = g \upharpoonright n \in T$ . So  $f \in [T]$ . So [T] is closed.

ROBEM II Assume f is isolated point in closed set  $F \subset \mathcal{N}$ , then  $\exists n \in \mathbb{N}, \forall g \in F, g \neq f \rightarrow g \upharpoonright n \neq f \upharpoonright n$ .

SOLTON. Since f is isolated, we get  $\exists n \in \mathbb{N}, \forall g \in F \setminus \{f\}, d(f,g) > \frac{1}{2^n}$ . Then  $f \upharpoonright n \neq g \upharpoonright n$ .

ROBEM III A closed set  $F \subset \mathcal{N}$  is perfect  $\iff T_F$  is perfect tree.

- SOUTION.  $\Longrightarrow$ : For  $t \in T_F$ , by defination we know  $\exists f \in F, n \in \mathbb{N}, t = f \upharpoonright n$ . Since f is perfect we know  $\exists g \in F \land g \neq f, d(f,g) < \frac{1}{2^{n+1}}$ . Then  $t = f \upharpoonright n \sqsubset g$ . Since  $f \neq g$ , we get  $\exists m \in \mathbb{N} \land m > n, f \upharpoonright m \neq g \upharpoonright m$ . So  $t \sqsubset f \upharpoonright m, t \sqsubset g \upharpoonright m$ , and  $f \upharpoonright m, g \upharpoonright m$  are incomparable.
- $\Leftarrow$ : For  $f \in F$ , we need to prove f is limit point.  $\forall n \in \mathbb{N}, t := f \upharpoonright n \in T_F$ . So  $\exists s_1, s_2 \in T_F$  such that  $t \sqsubset s_1, s_2$  and  $s_1, s_2$  are incomparable. Then  $s_1, s_2 \sqsubset f$  is impossible. Without loss of generality assume  $s_1 \not\sqsubset f$ . Then  $s_1 = g \upharpoonright m$  for some  $g \in F, m \in \mathbb{N}$ . So  $d(f, g) \leq \frac{1}{2^n}$ . So f is not isolated.

 $\mathbb{R}^{O}$ BEM IV For  $\alpha < \omega_1$ , we let  $\Sigma_0 =$  the set of all open set in  $\mathbb{R}$ , and  $\Pi_0 =$  the set of all closed set in  $\mathbb{R}$ . And  $\Sigma_{\alpha+1} = \{\bigcup_{n \in \mathbb{N}} A(n) : A \in {}^{\mathbb{N}}\Pi_{\alpha}$ .  $\Pi_{\alpha+1} = \{\mathbb{R} \setminus A : A \in \Sigma_{\alpha}\}$ .  $\Sigma_{\alpha} = \bigcup_{\beta < \alpha} \Sigma_{\beta}$ ,  $\Pi_{\alpha} = \bigcup_{\beta < \alpha} \Pi_{\beta}$  for limit ordinal  $\alpha$ . Prove that  $\mathcal{B}(\mathbb{R}) = \bigcup_{\alpha < \omega_1} \Sigma_{\alpha}$ .

SOUTION. Use MI easily we get  $\bigcup_{\alpha<\omega_1}\Sigma_{\alpha}\subset\mathcal{B}(\mathbb{R})$ . Now we prove  $\mathcal{B}(\mathbb{R})\subset\bigcup_{\alpha<\omega_1}\Sigma_{\alpha}$ . Since open sets is subset of  $\bigcup_{\alpha<\omega_1}\Sigma_{\alpha}$ , we only need to prove  $\bigcup_{\alpha<\omega_1}\Sigma_{\alpha}=:\mathcal{A}$  is  $\sigma$ -field. Easily we get  $\Sigma_{\alpha}\subset\Sigma_{\alpha+2}$ . Obviously  $\mathbb{R}\in\mathcal{A}$ . For  $A\in\mathcal{A}$ , assume  $A\in\Sigma_{\alpha}$ . Then  $\mathbb{R}\setminus A\in\Pi_{\alpha+1}\subset\Sigma_{\alpha+1}\subset\mathcal{A}$ . Assume  $A\in\mathbb{N}\mathcal{A}$ , let  $f\in\mathbb{N}\omega_1$ ,  $f(n)=\min\{\alpha\in\omega_1:A(n)\in\Sigma_{\alpha}\}$ . Consider sup ran  $f=:\gamma$ . Since  $\forall \alpha\in\mathrm{ran}\, f,\alpha$  is countable. And ran f is countable. So sup ran f is countable, thus sup ran  $f<\omega_1$ . Then ran  $A\subset\Pi_{\gamma+1}$ . So we get  $\bigcup_{n\in\mathbb{N}}A(n)\subset\Sigma_{\gamma+2}\subset\mathcal{A}$ . So we get  $\mathcal{A}$  is  $\sigma$ -field. So  $\mathcal{B}(\mathbb{R})\subset\mathcal{A}$ , thus  $\mathcal{A}=\mathcal{B}(\mathbb{R})$ .

 $\mathbb{R}^{OBEM}$  V Show that  $\mathcal{M} := \{A \subset \mathbb{R} : A \text{ is measurable}\}$  is a  $\sigma$ -field.

Lemma 1. For  $A \in {}^{\mathbb{N}}\mathcal{P}(\mathbb{R})$ , we have  $\mu^*(\bigcup_{n \in \mathbb{N}} A(n)) \leq \sum_{n \in \mathbb{N}} \mu^*(A(n))$ .

证明. For any  $\varepsilon > 0, n \in \mathbb{N}, \exists O(n) \in \mathcal{O}, A(n) \subset O(n) \wedge \mu^*(A(n)) \leq |O(n)| + \frac{\varepsilon}{2^{n+1}}$ . Let  $U := \bigcup_{n \in \mathbb{N}} O(n)$ , then  $\bigcup_{n \in \mathbb{N}} A(n) \subset U$ . So  $\mu^*(\bigcup_{n \in \mathbb{N}} A(n)) \leq |U| \leq \sum_{n \in \mathbb{N}} |O(n)| \leq \sum_{n \in \mathbb{N}} \mu^*(A(n)) + \varepsilon$ . Since  $\varepsilon$  is arbitry, we get the lemma.

Lemma 2. If  $G \in G_{\delta}$ , then  $\forall \varepsilon > 0, \exists O \in \mathcal{O}, G \subset O \land \mu^*(O \setminus G) \leq \varepsilon$ .

证明. We first consider G is bonded. Assume  $G \subset [-M, M], M > 0$ . Assume  $G = \bigcap_{n \in \mathbb{N}} O_n$ , where  $O_n \in \mathcal{O}$ . Then  $G = \bigcap_{n \in \mathbb{N}} (O_n \cap (-M-1, M+1))$ . By convinence we assume  $O_n \subset (-M-1, M+1)$ . And  $G = \bigcap_{n \in \mathbb{N}} \bigcap_{m=1}^n O_m$ , by convinence we assume  $O_n \supset O_{n+1}$ . Use LCDT we easily get  $\lim \mu(O_n) = \mu^*(G)$ . So we easily get the lemma.

Now consider general G. We can write  $G = \bigcup_{n \in \mathbb{N}} G_n$ , where  $G_n$  is bounded  $G_\delta$  set. So  $\exists O_n, G_n \subset O_n, \mu^*(O_n \setminus G_n) < \frac{\varepsilon}{2^n}$ . Let  $O = \bigcup_{n \in \mathbb{N}} O_n$  is OK.

SOUTON. First, for  $A = \mathbb{R}$ , easily we can let  $F = G = \mathbb{R}$ . Then F is  $F_{\sigma}$  and G is  $G_{\delta}$ . Second, assume  $A \in \mathcal{M}$ , consider  $B = \mathbb{R} \setminus A$ . Assume  $F \subset A \subset G$  and  $\mu^*(G \setminus F) = 0$ . Then  $G^c \subset B \subset F^c$ . And  $G^c$  is  $F_{\sigma}$ ,  $F^c$  is  $G_{\delta}$ . And  $\mu^*(F^c \setminus G^c) = \mu^*(G \setminus F) = 0$ . So  $B \in \mathcal{M}$ . Finally, assume  $A \in \mathbb{N} \mathcal{M}$ , we need to prove  $\bigcup_{n \in \mathbb{N}} A(n) =: A \in \mathcal{M}$ . Use AC we can find  $F \in \mathbb{N} F_{\sigma}$ ,  $G \in \mathbb{N} G_{\delta}$  such that  $F(n) \subset A(n) \subset G(n)$ ,  $\mu^*(G(n) - F(n)) = 0$ . Let  $T = \bigcup_{n \in \mathbb{N}} F(n)$ . Since F(n) is  $F_{\sigma}$ , we get  $T \in F_{\sigma}$ . And easily  $T = \bigcup_{n \in \mathbb{N}} F(n) \subset \bigcup_{n \in \mathbb{N}} A(n) = A$ . Now we let  $O(n, m) \in \mathcal{O}$ ,  $O(n, m) \in \mathcal{O}$ ,  $O(n, m) \setminus G(n) \subset O(n, m)$ ,  $\mu^*(O(n, m) \setminus G(n)) < \frac{1}{m2^n}$  by Lemma 2. Let  $G := \bigcap_{m \in \mathbb{N}} \bigcup_{n \in \mathbb{N}} O(n, m)$  is  $G_{\delta}$ . Easily  $\mu^*(G \setminus A) \leq \mu^*(G \setminus \bigcup_{n \in \mathbb{N}} G(n)) = 0$ . And  $A \subset G$ . So we get  $\mu^*(G \setminus F) \leq \mu^*(G \setminus A) + \mu^*(A \setminus F) = 0 + 0 = 0$ . So  $A \in \mathcal{M}$ .

 $\mathbb{R}^{OBEM}$  VI Show that  $\mathcal{A} := \{A \subset \mathbb{R} : A \text{ has property of Baire}\}$  is  $\sigma$ -field.

SOUTHON. Easily  $\mathbb{R}\Delta\mathbb{R}$  is meager, so  $\mathbb{R}\in\mathcal{A}$ .

If  $A \in \mathcal{A}$ , we need to prove  $\mathbb{R} \setminus A \in \mathcal{A}$ . Assume  $G \in \mathcal{O}$  and  $A\Delta G$  is meager, write  $B = \mathbb{R} \setminus A$ , only need to prove  $\exists U \in \mathcal{O}$ , such that  $B \setminus U, U \setminus B$  are meager. Let  $U = \mathbb{R} \setminus \overline{G}$ . Then  $B \setminus U = A \setminus \overline{G}$  is meager. Now only need to prove  $U \setminus B = \overline{G} \setminus A$  is meager. Since  $G \setminus A$  is meager, we only need to prove  $\overline{G} \setminus G$  is meager. In fact, we can prove  $\overline{G} \setminus G$  is nowhere dense. Consider  $I \in \mathcal{O}$ , we need to prove  $\exists J \subset I, J \in \mathcal{O}, J \cap \partial G = \emptyset$ . If  $I \cap \partial G = \emptyset$ , we can let J = I. Else, assume  $a \in I \cap \partial G$ . Form the defination of  $\partial G$ , we get  $\exists b \in I \cap G$ . Let  $J = I \cap G \neq \emptyset$  is OK. So  $B\Delta U$  is meager.

Assume  $A \in {}^{\mathbb{N}}\mathcal{P}(\mathcal{A})$ , we need to prove  $\bigcup_{n \in \mathbb{N}} A(n) =: A \in \mathcal{A}$ . Assume  $G(n) \in \mathcal{O}$  and  $A(n)\Delta G(n)$  is meager. Consider  $G := \bigcup_{n \in \mathbb{N}} G(n)$ . We only need to prove  $G\Delta A$  is meager. Only need  $G \setminus A$ ,  $A \setminus G$  is meager. Since  $G \setminus A \subset \bigcup_{n \in \mathbb{N}} G(n) \setminus A(n)$  and  $G(n) \setminus A(n)$  is meager, we get  $G \setminus A$  is meager. For the same reason, we get  $A \setminus G \subset \bigcup_{n \in \mathbb{N}} A(n) \setminus G(n)$  is meager.

So finally we get  $\mathcal{A}$  is  $\sigma$ -field.

ROBEM VII Assume  $A \subset {}^{\omega}\omega$  has the property of Baire, prove A is nonmerger  $\iff \exists O \in \mathcal{O}({}^{\omega}\omega), O \neq \emptyset \land O \setminus A$  is meager.

SPETION.  $\Longrightarrow$ : Since A has the property of Baire, we know  $\exists O \in \mathcal{O}, O\Delta A$  is meager. Then  $O \setminus A, A \setminus O$  are meager. Since A is nonmeager,  $A \setminus O$  is meager, we get  $O \neq \emptyset$ .

 $\Leftarrow=$ : Assume  $O \in \mathcal{O}, O \neq \emptyset, O \setminus A$  is meager. Noting  $O \subset O \setminus A \cup A$  and O is nonmeager, we get A is nonmeager.

 $\mathbb{R}^{OBEM}$  VIII Let  $C_A := \bigcup \{O_s : s \in {}^{<\omega}\omega, O_s \setminus A \text{ is meager}\}$ . Prove that  $C_A \setminus A$  is meager.

SOLITON. We know  $\mathbb{R}$  satisfy the second countable axiom, i.e.,  $\exists \mathcal{B} \subset \mathcal{O}({}^{\omega}\omega)$  such that  $\forall O \in \mathcal{O}, \forall x \in O, \exists B \in \mathcal{B}, x \in B \subset O$ . Now we consider  $\mathcal{X} := \{X \in \mathcal{B} : \exists O_s, X \subset O_s \land O_s \setminus A \text{ is meager } \}$ . Consider  $Y = \bigcup \mathcal{X}$ , we will prove  $C_A = Y$ .

On one hand, for  $x \in Y$ , we get  $\exists X \in \mathcal{X}$  such that  $x \in X$ . So  $\exists O_s$  such that  $x \in X \subset O_s \land O_s \setminus A$  is meager. So  $x \in C_A$ .

On the other hand, for  $x \in C_A$ , we get  $\exists O_s, x \in O_s, O_s \setminus A$  is meager. Since  $O_s$  is open, we get  $\exists B \in \mathcal{B}, x \in B \subset O_s$ . So  $B \in \mathcal{X}$ . Thus  $x \in Y$ .

So we get  $Y = C_A$ . So  $C_A \setminus A = Y \setminus A = \bigcup_{X \in \mathcal{X}} X \setminus A$ . From the defination of  $\mathcal{X}$  we know  $X \setminus A$  is meager, and Since  $\mathcal{X} \subset \mathcal{B}$  we get  $\mathcal{X}$  is countable. So finally we get  $C_A \setminus A = \bigcup_{X \in \mathcal{X}} X \setminus A$  is meager.

ROBEM IX Let  $\pi: {}^{\omega}\omega \to {}^{\omega}2, \pi(x) = s_{x(0)} {}^{\smallfrown}s_{x(1)} {}^{\smallfrown}\cdots$ . Where  $s_{x(k)} = 11 \cdots 10$  for even k, there is k "1" in total, and  $s_{x(k)} = 00 \cdots 01$  for odd k, there is k "0" in total. Prove that  ${}^{\omega}2 \setminus \operatorname{ran} \pi$  is countable.

SOLTON. As we all know,  $\{f \in {}^{\omega}2 : \limsup f = \liminf f\}$  is countable. So we only need to prove  $\forall f \in {}^{\omega}2 \setminus \min \pi$ ,  $\limsup f = \liminf f$ . Consider  $g \in {}^{\omega}2$  and  $\liminf g = 0$ ,  $\limsup g = 1$ . We only need to prove  $g \in \min \pi$ . Only need to prove  $\exists h \in {}^{\omega}\omega, \pi(h) = g$ . We construct h rescusively. Let  $h(0) := \min\{n \in \omega : g(n) = 0\}$ . Assume  $h \upharpoonright n$  is already defined. Let  $M(n) = \sum_{k=0}^{n-1} (h(k) + 1)$ . Let  $h(n) = \min\{k : g(M(n) + k) = a_n\}$ , where  $a_n = 0$  for even n and  $a_n = 1$  for odd n. Since  $\lim \inf g = 0 \land \lim \sup g = 1$ , we know h is well-defined. Now we prove  $\pi(h) = g$ . For k < h(0), form the defination of h(0) we know  $g(k) = 1 = \pi(h)(k)$ . For k = h(0) we get  $g(k) = 0 = \pi(h)(k)$ . Now assume  $\sum_{i=0}^{n} (h(i) + 1) < k \le \sum_{i=0}^{n+1} (h(i) + 1)$ . Easily we know  $\ln(s_{h(k)} = h(k) + 1)$ , so we get  $\pi(h)(k) = s_{h(n)}(k - M(n))$ . So from the defination of h(n) we easily get  $\pi(h)(k) = g(k)$ .  $\square$ 

ROBEM X Assume AD, then  $AC_{\omega}(^{\omega}\omega)$ . Consequently,  $\omega_1$  is regular.

SOLITON. Assume  $X: \omega \to \mathcal{P}({}^{\omega}\omega)$  and  $\forall n \in \omega, X(n) \neq \varnothing$ . Let  $\theta: {}^{\omega}\omega \to {}^{\omega}\omega, \theta(f)(n) := f(2n+1)$ . Consider  $A:=\{x\in {}^{\omega}\omega: \theta(x)\in X(x(0))\}$ . Since I have no w.s because  $\forall n\in \omega, X(n)\neq \varnothing$ . By AD we get II has a w.s., write  $\tau$ . Now consider  $\gamma: \omega \to {}^{\omega}\omega, \gamma(n) := \theta((n,0,0,\cdots)*\tau)$ . Since  $\theta((n,0,\cdots)*\tau) \in X(n)$ . So  $\gamma$  is the choose function.

Nov we prove  $\omega_1$  is regular. Only need to prove union countable many countable ordinal is countable. Assume  $f:\omega\to\omega_1$ , now we only need to prove  $\bigcup \operatorname{ran} f\in\omega_1$ . Consider  $F:\operatorname{ran} f\to \mathcal{P}(\omega\times\omega)$ ,  $F(\alpha):=\{R\subset\omega\times\omega:(\omega,R)\cong\alpha\}$ . Since  ${}^\omega\omega\approx\mathcal{P}(\omega\times\omega)$ , we get  $\operatorname{AC}_\omega(\mathcal{P}(\omega\times\omega))$ . So  $\exists \theta:\operatorname{ran} f\to\omega\times\omega$ ,  $\theta(\alpha)\in F(\alpha)$ ,  $\forall \alpha\in\operatorname{ran} f$ . Consider  $G:\omega\to{}^\omega\omega_1$ , G(n) is the isomorphic from  $(\omega,\theta(\omega))$  to f(n). Let  $h:\omega\times\omega\to\bigcup\operatorname{ran} f$ , h(n,m):=G(n)(m). Easily h is surjective. And since we have  $\operatorname{AC}_\omega(\mathcal{P}(\omega\times\omega))$ , we get  $\bigcup\operatorname{ran} f\approx A$  for some  $A\subset\omega\times\omega$ . So we get  $\bigcup\operatorname{ran} f$  is countable. So  $\omega_1$  is regular.
